

# P S ANALYTICAL

## **PRODUCT SPECIFICATION**

### PSA 10.536 MERCURY VAPOUR GENERATOR – RS485

The Mercury Vapour Generator is a calibration device for mercury analysers. The system operates on the principle of diluting a saturated source of mercury at known temperature. A low flowrate is passed across the mercury reservoir ensuring that the gas becomes saturated with mercury. The gas saturated with mercury is then diluted into the concentration range of interest. The flowrates are controlled using two mass flowcontrollers. The unit also generates an Hg free zero span so that blank measurements can be performed.

Hillsboro Blvd., Suite 318, Deerfield Beach, FL 33442, USA *Tel:* +1 (954) 429 1577 Fax: (954) 429 1601 E-mail: usa@psanalytical.com www.psanalytical.com The Modbus control allows the user to easily specify the Hg concentration desired and the software calculates the required flows.

The system is capable of providing a wide range of Hg concentrations by varying the mass flowcontroller and oven set-points (e.g. 3 ng m<sup>-3</sup> to 3000  $\mu$ g m<sup>-3</sup>). The unit has been used for numerous applications such as online calibrations, sampling system bias checks, spiking sample streams and for bench studies were precise concentrations of mercury are required.

By calibrating the PSA 10.525 Sir Galahad using the absolute vapour injection technique and then collecting fixed volumes of gas generated from the calibration device we were able to establish that the measured concentration was within 4% of the theoretical value based on the saturated vapour pressure calculations
